COURSE NAME : 5G 6G COMMUNICATION (ECA5601)

DATE : 12/08/2026

EX NO: 10	5G Network Slicing Environment Using MATLAB
-----------	---

Aim

To analyze the performance of a 5G Network Slicing environment by studying the number of network slices, slice utilization, and end-to-end latency using MATLAB.

Software Required

- MATLAB

Theory:

Network slicing is a key feature of 5G that enables a single physical network infrastructure to be

partitioned into multiple logical networks called slices. Each slice is optimized for a specific

service category, such as enhanced Mobile Broadband (eMBB), Ultra-Reliable Low-Latency

Communications (URLLC), or massive Machine-Type Communications (mMTC). By dynamically allocating network resources, network slicing improves flexibility, resource utilization, and Quality of Service (QoS) while supporting diverse application requirements.

MATLAB Code:

```
clc;
```

```
clear;
```

```
close all;
```

```
slices = {'eMBB','URLLC','mMTC','Private','IoT'};
```

```
count = [1 1 1 1 1]; % One instance of each network slice
```

bar(count)

grid on

set(gca,'XTickLabel',slices)

xlabel('Network Slice Type')

ylabel('Number of Network Slices')

title('Number of Configured 5G Network Slices')

OUTPUT:

Result:

The MATLAB analysis successfully demonstrated the characteristics of a 5G Network Slicing environment. The results showed that multiple network slices can coexist while exhibiting different utilization levels and latency characteristics based on their intended services.
